

The SysAdmin Pro module adds additional functionality for PBX management to the included SysAdmin module.

**DDNS** - This module uses DDNS to track both the smart and external DDNS name and address.

**Email Setup** - With this module, you can set your SMTP server information to receive e-mail notification and voicemail to e-mail.

**UPS Management** - UPS management can be directly integrated into the PBX. This can be used to properly shut down the PBX in case of power loss. This module can also alert you to power-related issues.

**Update Management** - The Updates Management module allows you to check your current system version at a glance, view available updates, and schedule when updates will be applied to the system. You can also watch the upgrade process in progress.

**Support VPN** - You can create a VPN tunnel to the technical support team to give them access to your system. This tunnel is off by default, and you can start or stop it.

**VPN Server** - You can set up the PBX with a VPN server to allow your clients to connect directly to the PBX.

**FTP Server** - You can enable and disable an FTP server and set a username and password. This FTP server points to the /tftboot directory where all your phone configs are stored by End Point Manager.
