# Web Call Back

The Web Callback module allows you to easily add an HTML call-me box to your web site. Visitors enter their phone number into the field in order to be connected with a specific destination. The Web Callback module allows you to prepend information to the caller ID, which can alert you that the call is coming from a specific callback. You can also set dial matches to specify which numbers users are allowed to call. Once you have set your destination and saved changes, you will receive HTML code to paste into your website.

The screenshot shows the 'Web Callback' configuration page in FreePBX. It features several input fields and a preview section. The 'Name' field contains 'Call Me'. The 'CID Prepend' field contains 'Sales'. The 'Number Prepend' field is empty. The 'Dial Matches' field contains 'NXXNXXXXXX' and '1NXXNXXXXXX'. The 'Icon' section displays five 'Click to Call' buttons with different colors and icons. The 'Valid Message' field contains 'Connecting your call...'. The 'Invalid Message' field contains 'Invalid number. Please enter a 10- or 11-digit number.'. The 'Error Message' field contains 'Oops, something went wrong.'. The 'Destination' dropdown menu is set to 'Queues' and shows 'Support <5000>'. The 'HTML Code' section contains the text 'Please save to see the generated code'.
